

Confirmation on exclusion of strains which result from Protoplast/Cytoplast fusion

Naturland excludes for its operators the use of strains which result from protoplast fusion or cytoplast fusion or comparable methods (at the level of the cell nucleus) (see Naturland Standards B.I.3.).

These breeding techniques are currently mainly applied in the cabbage family (Brassica) but more and more also in chicory (Cichorium).

Before the use of F1-hybrid seed material of brassica or chicory or the use of respective plant materials or seedlings the Naturland operator has to obtain a respective confirmation of the seed producer/ supplying company. The documentation of these confirmations will be checked during the annual inspection.

Naturland licensee
(name, address):

Operator code (BN):
Used seed-, plant
material/seedlings
(strains, name of seed
producer):

To be signed by seed producer respectively the supplier:

Seed producer resp. supplier
